

Effective Passive Fire Protection for Service Penetrations in Buildings

CPD Training

As part of our mission to educate the construction industry about the importance of passive fire protection, we offer a CPD training on Effective Passive Fire Protection.

The 60-minute training raises awareness of the importance of early engagement thus ensuring compliant installations and enables effective design and specification of complete passive fire protection systems.

The CPD certified training also provides an overview of solutions available and what to look for to ensure suitability and compliance.

We offer **dedicated sessions** (online or face to face) to organisations that can bring 10+ delegates to the training.

It is also available as a **webinar every month** open to individual registration.

WHO IS THE TRAINING FOR?

The training is primarily aimed at specifiers but is highly beneficial for anyone involved in the design or management of the installation of firestopping solutions; architects, designers, contractors, project managers, consultants and surveyors.

WHAT DOES THE TRAINING COVER?

- ❏ Why passive fire protection is so critical
- ❏ The concept of fire compartmentation
- ❏ What is intumescent material and how does it work
- ❏ The importance of test evidence and certification of passive fire protection products
- ❏ The 5 key areas of passive fire protection
- ❏ A detailed overview of service penetrations: pipe & duct penetration sealing, electrical service penetration sealing
- ❏ Products and solutions available on the market and criteria to be considered when choosing a suitable firestopping solution
- ❏ Examples of poor and good installation
- ❏ Q&A session
